

血液透析(俗稱「洗血」)是末期腎病患者的常用治療方法,透過血液透析機將病人的血液從身體引流至人工腎臟,淨化後再回流體內。病人每星期約需進行2至3次治療,每次需時4至6個小時。

Haemodialysis is a common treatment modality for patients suffering from end-stage kidney disease. Patient's blood is directed to an "artificial kidney" by the haemodialysis machine for purification. After wastes or toxins are removed, the blood will be returned back to the body. Each dialysis session lasts about 4 to 6 hours. Patients usually receive 2 to 3 treatments a week.
